Next Generation Perimeter Security Technology on Show at Energy Infrastructure Security Summit

Middle East Company News (October 18, 2009)

Hundreds of installations around the world, in some of the most hostile environments on the planet, are protected by a unique fibre optic perimeter intrusion detection system. From Future Fibre Technologies, this next generation technology stands alone for optimum, fail safe security protection.

About FFT: Since its establishment in 1994, FFT has successfully positioned itself to be the technology of choice for large perimeter applications, pipeline monitoring and communications/data network security, with hundreds of systems being deployed globally, in a range of applications including the oil and gas industry. This strong growth led FFT

to open a new office in Dubai to service and support the company's growing activity across the Middle East and North Africa (Mena) regions. The Middle East's high proportion of critical infrastructure, its political instability and increasing global energy prices combine to present special challenges to the suppliers and operators responsible for protecting the critical oil and gas infrastructures in the region. The opening of the new office signals FFT's commitment to increasing awareness and knowledge of fibre optic based security solutions in the region. In recent years, the company has been active in many projects in the region including the highly successful deployment of perimeter intrusion detection systems for several seaports and for a large number of LNG and petrochemical plants. Adam Wilding-Webb, FFT's Mena Regional Manager, manages FFT's new office, which houses a full demo suite for Technical Training & Product Demonstrations along with local sales and technical support staff. Mr. Wilding-Webb, who has worked with security products and systems for many years in Dubai, is familiar with the special challenges facing those responsible for security in the region and his expertise in the two key areas - the plant and equipment (oil refineries, LNG plants, etc.), and the products' transportation (pipelines) - will assist the company's new and existing customers in identify the best solution available. See for yourself why FFT is the ultimate force in fibre optic intrusion detection and location systems. Visit the team at the Summit or visit http://www.fftsecurity.com.
