Future Fibre Technologies Awarded Airbase Perimeter Intrusion Detection Project

Future Fibre Technologies (FFT), the world leader in fibre optic intrusion detection, in conjunction with one of its key System Integrators has been awarded the perimeter protection of a sensitive military airbase in Asia-Pacific.

Utilising the FFT Secure Fence™ system, this installation will protect aircraft and equipment by pinpointing the location of intrusions anywhere along the perimeter fence which is in excess of 7,000 metres long.

This builds on FFT's impressive record of success and experience in securing the perimeters of government and military installations.

The Government client recognised the advantages of the FFT Secure Fence™ system including its ease of installation, ability to operate in harsh tropical conditions, flexibility of its overall design, local technical support capability, and FFT's global experience were the critical winning factors.
