### Future Fibre Technologies Awarded 250 km Perimeter Intrusion Detection Project

Future Fibre Technologies (FFT), the world leader in fiber optic intrusion detection, working with one of its key Global System Integrators, has been awarded another large perimeter intrusion detection project.

Utilizing the FFT Secure Fence system, this Middle East installation will protect a perimeter fence in excess of 250km long and builds on FFT's impressive successes and experience in securing the perimeters of large infrastructure projects.

The Government client recognized the advantages of the FFT Secure Fence system including its ease of installation, ability to operate in the harshest desert conditions, flexibility of its overall design, local technical support capability and FFT's global experience, in choosing the company to protect this highly sensitive, remote site.

FFT has been active in the Middle East with many projects in recent years including the highly successful deployment of perimeter intrusion detection systems for several seaports and for a large number of LNG and petrochemical plants.

FFT's Dubai office provides Technical Training & Product Demonstrations for the region along with local sales and technical support staff.
